

# EPIDEMIOLOGIC COHORT STUDY OF INTERSTITIAL CYSTITIS / BLADDER PAIN SYNDROME AND HYSTERECTOMY: THE CONFOUNDING EFFECT OF COMORBIDITIES

## Hypothesis / aims of study

The diagnosis of interstitial cystitis/bladder pain syndrome (IC/BPS) can be elusive and often confused with gynecological conditions. The difficulty of accurately identifying IC/BPS may result in unnecessary hysterectomies, especially when confounded by comorbidity. Clinicians have noted that large proportions of patients with IC/BPS had a history of hysterectomy [3]. We investigated the causal effect of IC/BPS on hysterectomy and the confounding effect of comorbidities in a large nationwide cohort study.

## Study design, materials and methods

This retrospective cohort study searched the national insurance database for those patients with a new diagnosis of IC/BPS from 2002 through 2013. After limiting our sample to women with a diagnosis of IC/BPS, we identified the IC/BPS cohort. Women with a history of hysterectomy before IC/BPS diagnosis were excluded. Women with IC/BPS were matched 1:1 with women without IC/BPS by propensity scoring using confounding factors, including age and five comorbidities (leiomyoma, adenomyosis, endometriosis, pelvic organ prolapse, pelvic pain). Univariate and multivariate analysis of the association between IC/BPS and hysterectomy were compared in these two cohorts.

## Results

A total of 3008 women, divided into two cohorts, were identified. According to univariate analysis with the chi-square test, the association between IC/BPS and hysterectomy was found to be significant (P=0.000). However, according to multivariate analysis controlling for age and five comorbidities, the hazard ratio (HR) of hysterectomy in the non-IC/BPS cohort compared with the IC/BPS cohort was 1.518 (95% CI= 0.948-2.432, p=0.083), which was not significant.

## Interpretation of results

From the LHID2010 data, our cohort study revealed that IC/BPS is not a risk factor for hysterectomy. Multivariate analysis with comorbidities as confounding factors should be utilized to confirm the results, which may have been influenced by univariate analysis.

## Concluding message

IC/BPS was not a risk factor of hysterectomy when considering the confounding effect of comorbidity.

Retrospective cohort design for IC/BPS and Hysterectomy

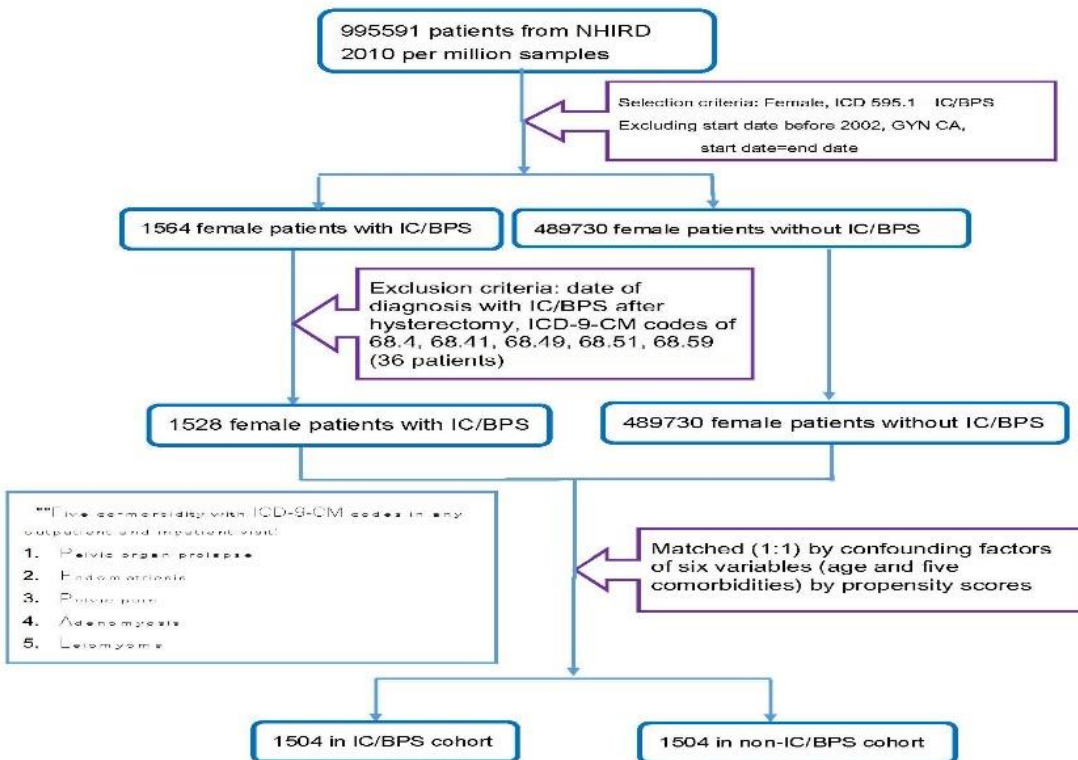

Figure. Flowchart of sample selection

Table 1. Demographic characteristics of patients in the IC/BPS cohort and non-IC/BPS cohort (n=3008)

| variable                      | IC/BPS cohort<br>(n=1504) | non-IC/BPS<br>cohort(n=1504) | P     |
|-------------------------------|---------------------------|------------------------------|-------|
| <b>Age (y/o)</b>              | 47.82 ± 16.25             | 47.25 ± 16.82                | 0.344 |
| Mean (range)                  | (3.39-97.95)              | (0.11-98.04)                 |       |
| <b>Leiomyoma</b>              |                           |                              | 0.394 |
| Mean physician visits (range) | 1.31 ± 4.28 (0-67)        | 1.18 ± 3.59 (0-51)           |       |
| <b>Adenomyosis</b>            |                           |                              | 0.372 |
| Mean physician visits (range) | 0.47 ± 3.09 (0-76)        | 0.39 ± 2.09 (0-30)           |       |
| <b>Endometriosis</b>          |                           |                              | 0.277 |
| Mean physician visits (range) | 0.52 ± 6.23 (0-214)       | 0.34 ± 2.17 (0-51)           |       |
| <b>Pelvic organ prolapse</b>  |                           |                              | 0.965 |
| Mean physician visits (range) | 0.26 ± 1.67 (0-39)        | 0.26 ± 1.69 (0-39)           |       |
| <b>Pelvic pain</b>            |                           |                              | 0.807 |
| Mean physician visits (range) | 0.10 ± 0.92 (0-27)        | 0.09 ± 0.87 (0-28)           |       |

Mean physician visits = (Total number of outpatient visits + Total number of admissions) / Total patient number

Table 2. Univariate analysis (chi-square) of the association between IC/BPS and hysterectomy

| variable            | Hysterectomy (n, %) |           | Chi-Square | P      |
|---------------------|---------------------|-----------|------------|--------|
|                     | no                  | yes       |            |        |
| <b>IC/BPS</b>       |                     |           | 18.606     | 0.000* |
| <b>No</b> (n=1504)  | 1434 (95.3%)        | 70 (4.7%) |            |        |
| <b>Yes</b> (n=1504) | 1476 (98.1%)        | 28 (1.9%) |            |        |

\* indicates P<0.05

Table 3. Univariate analysis (logistic regression) of the association between confounding factors and hysterectomy

| Variable (physician visits)  | Wald   | p      |
|------------------------------|--------|--------|
| <b>age</b>                   | 1.955  | 0.162  |
| <b>Leiomyoma</b>             | 50.141 | 0.000* |
| <b>Adenomyosis</b>           | 40.925 | 0.000* |
| <b>Endometriosis</b>         | 4.445  | 0.035* |
| <b>Pelvic organ prolapse</b> | 14.041 | 0.000* |
| <b>Pelvic pain</b>           | 0.046  | 0.830  |

Physician visits = Number of outpatient visits or admissions, \* indicates P<0.05

Table 4. Hazard ratio (HR) of hysterectomy in the non-IC/BPS cohort compared with the IC/BPS cohort (n=3008)

|                              | non-IC/BPS cohort vs. IC/BPS cohort, HR(95%CI) | p      |
|------------------------------|--|--------|
| <b>IC/BPS(no/yes)</b>        | 1.518 (0.948-2.432)                            | 0.083  |
| <b>age</b>                   | 0.994 (0.981-1.007)                            | 0.357  |
| <b>Leiomyoma</b>             |  |        |
| Per physician visit          | 1.065 (1.047-1.083)                            | 0.000* |
| <b>Adenomyosis</b>           |  |        |
| Per physician visit          | 1.056 (1.038-1.075)                            | 0.000* |
| <b>Endometriosis</b>         |  |        |
| Per physician visit          | 1.011 (0.997-1.026)                            | 0.127  |
| <b>Pelvic organ prolapse</b> |  |        |
| Per physician visit          | 1.062 (1.024-1.102)                            | 0.001* |
| <b>Pelvic pain</b>           |  |        |
| Per physician visit          | 0.981 (0.746-1.290)                            | 0.891  |

Adjusted confounders: age, physician visit for leiomyoma, adenomyosis, endometriosis, pelvic organ prolapse, pelvic pain; HR=Hazard ratio; Physician visit = Number of outpatient visits or admissions;
